Tougher

A concise guide to the survival rules.

Tougher makes ordinary survival stricter: tools wear out, crops fail, hunger only falls while you act, and mana abilities, achievements, and village homes sit on top of that. In game, type `/tougher help` for topics, `/tougher ability help` for abilities, and `/tougher me` for your own mana and skills. Hold an ability item and press ? for that ability.

Mining and tools

- Stone and deepslate need an iron pickaxe or better. Breaking coal or ore softens only the blocks around that ore. Dirt, cobble, and that softened stone can keep falling out to 50 blocks, one step at a time.
- Wood, stone, and copper tools last one-third as long as usual.

Building

- You cannot place a solid block while in the air, including while standing on the very edge of a block. On the ground, a bridge over a gap is allowed.
- Master Builder suspends that limit while it runs and adds its level to your block reach. Double-right-click a clay brick. Torch rules stay.
- Torches, lanterns, and glowstone cannot be carried in the off hand.
- Bucketed water and lava are not sources, except in a sealed 1x1x1 hole or receptacle that does not touch a source.
- A boat that falls more than 3 blocks with you in it breaks and drops nothing.
- Breaking a block that is on fire sets you on fire, the same as putting the fire out by hand. Water still works.
- Sneak with a compass to point it at your bed or respawn anchor. With none set, it still points at world spawn.
- One right-click with a compass says the biome you are in and the direction you face, such as You are in the Plains facing North. The second click within half a second casts Detect ore.
- A bed placed in the Nether or the End vanishes. It does not explode. A bed already there is removed instead of exploding if you use it.
- Breaking a bed destroys it and drops nothing: no bed, wool, or planks.
- A lodestone is crafted with an iron block in the middle, surrounded by chiseled stone bricks.
- A copper chest you place is yours for 90 Minecraft days. Only you can open it, pick it up, break it, or change a sign on it. Opening it starts the 90 days again. Waxed and weathered copper chests keep that lock.
- A sign on that chest names other players, one on each line. They can use it as you can, and opening it starts the 90 days again. Anyone else who looks at the chest sees how many days remain until it is public.
- A second copper chest joins another only when you own that one. Sneak to place yours beside a chest you do not own.
- Pistons, explosions, and copper golems cannot empty or move a locked copper chest.
- A hopper you place is yours for 90 Minecraft days. Only you can open it, pick it up, break it, or change a sign on it. Opening it starts the 90 days again.
- A sign on that hopper names other players, one on each line. They can use it as you can. Anyone else who looks at the hopper sees how many days remain until it is public.
- A hopper you own can pull from and put items into a container you own, or one nobody owns. Another player's locked chest or hopper stays closed to it.

Torches and campfires

- Placed torches need airflow and a firm block. Campfires need airflow too.
- Torches burn out after 7 Minecraft days and start dimming after 2. Light is 14 minus (days burning minus 2). Copper torches last twice as long.
- Copper lanterns below Y=0 lose 1 light for every 5 blocks below. At Y=-5 the light is 1 lower. At Y=0 and above they stay full.
- Right-click a torch with coal or charcoal to add 40 days (80 on copper). That does not make it permanent.
- Look at a torch or campfire to see the time left. Redstone torches are permanent: they do not burn, dim, or show a duration.

- Breaking a torch with less than 3 days left destroys it. Permanent torches still drop.
- Campfires also last 7 days unless they pull a log from a chest within 12 blocks, which adds 7 more days.

Hunger

Hunger drops while you move or act, not while you stand still. Swimming drains saturation twice as fast, and sprint-swimming four times as fast. Hunger follows once saturation is gone. Each point of weight over your limit raises saturation loss by 2%. A food you have not eaten in your last 7 meals gives +1 hunger, or +1 saturation if the bar is already full. Seven different foods in the last 7 meals gives another +1 hunger, +1 saturation, and 3 experience, and it can happen again on later meals that keep that streak. A slice of cake counts as its own food. The same food 5 times in the last 7 meals restores less; 7 of the last 7 restores even less. A meal still gives at least 1 hunger, and saturation does not fall. Foods in an inventory, chest, bundle, shop, hotbar, or on the cursor show a small mark in the top right. A black X means very sick of it, and a brown down mark means sick of it. Those follow the same-food penalty, so Well Fed delays them. A brown number is how many meals ago you ate a food in the last 7. A yellow number is how many meals ago you last ate that food. It is a slight craving when eating it weakens the run, and within grace when the repeat still fits. A green minus maintains the Well Fed run. It is the oldest meal of that run, and that food appears only once. Above the offhand, a mana crystal shows Mana as your base mana level over your learning capacity, like 3/7, when that capacity is above 0. A chicken above that shows your Well Fed level when it is above 0. A green up mark is a craving. Repeats fill the extra slots, so the oldest meals drop out of the variety run, and eating them builds it back up. The locator bar is off until you eat a golden carrot. It stays on until your saturation is gone. Another player sees you only while their own bar is on too.

Well Fed

After those seven different meals, every two more different meals raise Well Fed by one. Nine different meals in a row is Well Fed 1. Thirteen is Well Fed 3. It can go higher. At Well Fed 3 the last 16 meals allow 3 repeats. Each one pushes the oldest meal out of the 13. That grace grows with every level. The same-food penalty also waits one extra repeat per level. Dying clears the meal history, so Well Fed starts over. Losing a level removes exactly that level's benefits. Health and hunger clamp down. The mana level leaves, but mana you already hold is kept. That is not an extra hit.

These leave when Well Fed drops:

- +1 health point per level, arriving filled. Odd totals show a half heart outline.
- +1 hunger per level, arriving filled. You can keep eating until that higher bar is full. Eating is no longer blocked at 20.
- +1 mana level for every 3 Well Fed levels, rounded down. Well Fed 3 is +1. It does not arrive filled, and eating does not restore mana.
- +1 melee damage for every 8 Well Fed levels, rounded down. Well Fed 8 is +1.
- Food regen is 1 second faster for every 3 Well Fed levels, rounded down, and never faster than once every 5 seconds.
- Saturation loss falls 1% per Well Fed level, up to 30%.

Creative mode and spectators do not get Well Fed.

Crops, trees, and hives

- Crops grow slowly. Sugar cane is one-tenth speed. Cocoa beans and nether wart are one-twentieth. Trees take 10 times as long, and leaves drop half as many saplings. Each sapling that would still drop has twice the crop loss rate as a percent chance not to, so at 50% loss or higher none drop.
- A ripe cocoa pod drops 1 or 2 cocoa beans. One more bean drops when a d100 is under the hoe quality plus the tree. Quality is iron 0, diamond 10, gold 20, and netherite 30. Each Efficiency level adds 2. Wood, stone, and copper hoes are 0. Each other pod on that tree is -2%. Each jungle log is +2%, up to +20%.
- A one-block cane that would grow a second segment may become a weed, using the current crop-loss rate plus the soil under it.
- Pumpkins and melons fruit at one-tenth speed. After each fruit the vine may become a weed, starting at 0% and rising 5% per fruit. Broken vines drop no seeds.
- Shearing a full hive gives 1 honeycomb.
- A bee that returns with nectar fills a hive or nest at farming.beeHoneyPercent, default 20, plus the square root of each flower type within 29 blocks. That rate is stored once a Minecraft day, up to 100. 0 never fills. A clock on a hive or nest states that hive's honey production.

Soil

Unworked soil shows 0. Look at farmland, a crop, or sugar cane to see the plot's modifier. Green and positive is good. Red and negative is bad. The first till scores water sources within 2 blocks, up to 30. Past 30, each extra source subtracts 1, down to 0. A roll of 1 to 10 is then subtracted, and twice the hoe quality is added: wood or stone 0, copper 2, iron 4, diamond 6, gold 8, netherite 10. A hoe that breaks on that till still counts. Later hoeing steps the plot toward the hoe's target (wood or stone -10, copper -5, iron 0, diamond +10, gold +20, netherite +30). Each Efficiency level adds 0.25 to that target's hoe quality: wood or stone 0, copper 1, iron 2, diamond 3, gold 4, netherite 5. A worsening step is one-tenth of the gap (at least 1, at most 4). An improving step is 3. Harvesting without a hoe subtracts 5. Replanting the same crop subtracts 5. Let it grow adds 3 under each plant it grows. Bone meal adds 5.

Seasons

By default, crop loss falls 1% per day from the normal rate down to half, then rises to three times that rate, then repeats. Growth never exceeds vanilla, and ripe food crops can die at the seasonal loss plus the plot's soil modifier. Above 25% loss, cows, sheep, and pigs drop 1 less meat. Above 60%, those animals drop 2 less, chickens drop 1 less, bees stay in their hives, and the air looks blighted. Let it grow does not cause that crop death.

Animals and processing

- Animals wait 6 times as long to breed. Chickens lay eggs 6 times as slowly.
- Grass spreads onto dirt from farming.grassGrowthPercent. -1, the default, is 40 minus half the current crop loss rate, and never below 0. 0 never spreads. A positive number is that percent of the usual spread, and 100 is the usual rate. A fence, gate, door, wall, or other block that leaves the top of the grass open does not stop that spread.
- Livestock overgraze by eating grass they can walk to within 6 blocks and turning that block into dirt. Bees do not. About 9 grass blocks keep a large animal fed. About 4 keep a chicken or rabbit fed.
- Sheep overgraze too, and wait 6 times as long to eat grass and regrow their wool. farming.sheepWoolGrazeMultiplier of 1 is the usual wool wait.
- If no grass block is in reach, an animal has a 33% chance to eat from a chest or barrel it can reach within 20 blocks. It eats short grass, the item shears collect, before its breeding food. If neither is left, a second 33% chance starves it and it drops no meat.
- Crowding damages villagers, not livestock. Eight or more in a 3x3x3 take damage. Residents and named villagers are spared. Set farming.overcrowd.villagersOnly false to crowd animals too.
- Ordinary villagers take 8 times as long to restock. A novice fletcher buys 32 flint for 1 emerald. That is separate from residents.
- An unemployed villager cannot take a job once that job has the rounded-up eighth of the villagers within 64 blocks.
- A librarian's enchanted book cannot be a higher level than that librarian. Higher ranks also sell the enchantments from earlier ranks, and can roll them higher. A novice sells Efficiency only at level 1. A master can sell it at level 5.
- Composters fill normally but finish slowly. Hopper output from furnaces and composters stores cooking experience in the destination chest at 50% extra.

Combat

- Mobs hit harder. Skeletons ignore arrows. Zombies vary about 20% in speed: faster ones hit softer and look smaller.
- Below Y=48, a cave you have walked may spawn an extra hostile. The light may be 11, and every 20 blocks you are below Y=48 adds 1, so Y=28 allows 12 and Y=8 allows 13. The chance falls by 5% times the light of the chosen block.
- After 100 player kills of hostile mobs anywhere in one chunk, hostile spawns at Y=48 and above stop. Neutral and friendly mobs still spawn. Players in or near that chunk are told the area is being cleared for the alliance, and gain 25 experience and an emerald. Once each Minecraft day, entering each full chunk plays a quiet chime. monsters.chunkClearKills of -1 turns it off.
- Below Y=0 in the overworld, normal hostile mobs can spawn in block light of 1 for every 15 blocks down. At Y=-15 that is light 1. At Y=-30 that is light 2.
- Skeleton and bogged special shots are 1% per 10 blocks from world spawn, and certain at 1,000 blocks or farther.
- Zombies can rise again. Shields absorb the whole blocked hit and last one-third as long.
- A zombie that rises from its head has half its health, 30% more damage, and 20% more speed. Its hands sparkle red.

- Creepers may drop live TNT. TNT sets fire to 20% of the blocks it hits, rounded. Set explosions.tnt.firePercent to 0 to turn that off.
- Within 5 blocks, an enderman teleports you to it every 3 seconds when it cannot path to you, or when you are standing in a space only 2 blocks tall.
- Breaking a burning block sets you on fire, as above.
- Lives start off. player.death.lives starts at -1. 0 or above gives each player that many lives. Each death spends one, and the count can go below 0. At 0 lives, base health stays 10 hearts. Below 0, base health is 20 plus 2 for each life, and at least 6 (3 hearts). On death, a count above -1 says how many lives remain. Below 0 it says you are down that many hearts. player.death.restoreLifeAvailable starts on. Restore Life works only while lives are on. Past level 32, each missing life returns. It costs 250 experience plus 250 for every life below full, and never more than the experience you have.

Biome bosses

A strong boss can appear far from spawn. The same family can appear again 500 blocks or more from every earlier spawn of that family. Bosses do not spawn within 80 blocks of a player or a chest. Within 64 blocks, a biome boss shows a health bar with its name. A brood mother keeps chasing when hit, and every few seconds spits for half her bite damage and a brief blindness. If a boss cannot walk to you, it breaks blocks in the way at iron-pickaxe speed. If it is stuck inside a wall, it teleports to the nearest open spot and keeps fighting. Killing an overworld boss summons a vex, a witch, a skeleton, a creeper, a zombie, a phantom that does not burn in sunlight, and two zombified piglins. Each defeat makes the next boss 30% harder and richer. The third is a world event. The seventh rolls the credits, and you can keep playing.

There are 17 biome bosses, one for each family. Several biomes share one boss.

- Lush Cave Broodmother: Lush Caves.
- Sulfur Magma Titan: Sulfur Caves.
- Dripstone Drowned: Dripstone Caves.
- Dark Forest Horde King: Dark Forest and Pale Garden.
- Jungle Brood Spider: Jungle, Sparse Jungle, and Bamboo Jungle.
- Desert Husk Champion: Desert, Badlands, Eroded Badlands, and Wooded Badlands.
- Swamp Hex Witch: Swamp and Mangrove Swamp.
- Mushroom Horde King: Mushroom Fields.
- Ocean Guardian: Ocean, Cold Ocean, Lukewarm Ocean, Warm Ocean, Frozen Ocean, and all four deep oceans.
- Savanna Ravager: Savanna, Savanna Plateau, and Windswept Savanna.
- Plains Ravager: Plains, Sunflower Plains, and Meadow.
- Cold Stray Sniper: Snowy Plains, Ice Spikes, Taiga, Snowy Taiga, both old-growth taigas, Grove, Snowy Slopes, Frozen Peaks, Jagged Peaks, Stony Peaks, Windswept Hills, and Windswept Gravelly Hills.
- River Drowned: River, Frozen River, Beach, Snowy Beach, and Stony Shore.
- Forest Broodmother: Forest, Flower Forest, Birch Forest, Old Growth Birch Forest, Cherry Grove, and Windswept Forest.
- Nether Blaze Lord: Nether Wastes.
- Crimson Hoglin: Crimson Forest.
- Soul Sand Wither Knight: Soul Sand Valley.

These biomes never spawn a biome boss: Deep Dark, Dappled Forest, Warped Forest, Basalt Deltas, The Void, and every End biome.

Armor

A full set of heavy copper, iron, diamond, or netherite armor adds 5, 10, 20, or 30 hearts. Those pieces last twice as long as the matching vanilla pieces. Healing and food regen fill every heart, not only the first ten. Unarmored, leather, and chainmail move 10% faster than usual. A full set of copper, iron, or gold armor slows that pace by 10%. A full set of diamond or netherite armor slows it by 5%. Heavy armor slows 5% more than its material for a full set, so heavy iron slows by 15% and heavy diamond or netherite slows by 10%. Each worn piece applies one quarter of its full-set amount. The config keys are player.armor.copperIronGoldSlowdownPercent, player.armor.diamondSlowdownPercent, player.armor.leatherChainmailSlowdownPercent, and player.armor.heavyExtraSlowdownPercent.

Weapons

Heavy swords and axes of copper, iron, gold, and diamond use the same recipe as the normal weapon, with blocks in place of ingots. They last three times as long and deal 2 more damage. Repair them with those blocks. Smith the heavy diamond sword or axe with a netherite upgrade template and a netherite ingot. That ingot repairs the netherite weapon. A heavy golden sword casts Smite Evil, the same as a golden sword. A slain biome boss can also drop an enchanted heavy sword or axe. The chance starts at 25% and rises as that boss is richer.

Mana

Mana is shown as cyan crystals. Two mana points fill one crystal. Above 3 mana, blue sparkles show for a second or two every 30 to 60 seconds, one for each point of mana. You regenerate (mana level + current mana) / 200 per minute. Saturation of 18 or more doubles that regen and is not consumed. Below 18 the bonus stops. A quartz block double-right-clicked in the air casts Battery. It costs no mana. Battery lasts 2 minutes per ability level, at least 2 minutes, and multiplies mana regeneration by 1 plus the square root of its level. It renews until your mana reaches your mana level. Past your level, regeneration is one-quarter speed. Crystals you will gain in about ten minutes show faintly, the same way they will look. That grows when you are well fed or Battery is on, and shrinks once you are past your mana level. The old ceiling of 40 mana rises when Well Fed or ready gold pushes your level past 40. Achievements can raise the permanent mana level. Well Fed adds one level for every three Well Fed levels, and those extra levels leave when Well Fed drops. Ready gold adds mana levels too, and those leave when the gold comes off.

Abilities

Double-right-click the catalyst within half a second. Level is the square root of uses, plus item bonuses, minus 2, and at least 0. A cast consumes one catalyst. Two in hand consume both and add 2. One consumed catalyst adds nothing. Swords, hoes, and pickaxes are not consumed. A renew spends no catalyst unless you are holding it, which spends one and adds 2. Glowstone dust casts Empower. It lasts 30 seconds per ability level, at least 30 seconds, and does not renew on its own. While Empower lasts, each later mana ability cast gains extra level equal to the square root of Empower's level. Gold armor adds 1 mana level after 90 seconds, then 180, 360, and 720 seconds more. Four pieces put on together reach +4 in 1350 seconds. A golden item in either hand, such as a golden hoe, adds 1 more mana level after 30 seconds. Gold ingots, nuggets, blocks, and ore do not. The bonus ends the moment that item comes off, and a half-second golden shimmer plus "Mana level +1 (+total)" plays when a piece starts counting. A golden hoe still keeps its usual Let it grow material bonus on top of that.

- Paper: Healing. The health is spread across the 6-second blue sparkle. A honey bottle adds +4 and is consumed, including the bottle. Iron ingot: Iron Heart. Feather: Flight. Sneak on a block to stop; sneaking in the air descends. A phantom membrane in the hotbar or inventory, not a bundle, adds +3 to Flight. One is consumed, and each renew consumes another to keep that +3. Arrow: Missile Storm. It launches one arrow per level, rounded down, and each deals that much magic damage. Armor does not reduce it, and skeletons do not deflect it. Witches resist it. The arrows seek hostiles in range. One hostile can be hit more than once, and the shots spread so they do not overkill while another target can take the hit. Cooldown is 10 seconds minus skill. One arrow is consumed. Two or three consume two and add +2. More than 3 arrows doubles the level, adding at most the square root of the arrows in hand, rounded down, and that many arrows are consumed. Four arrows still costs 2. Charcoal in the hotbar or inventory, not a bundle, adds +2. One charcoal is consumed, and the arrows burn.
- Any hoe: Let it grow, on a plant. Any pickaxe: Power mining. Compass: Detect ore. The compass is kept. Nether quartz is not required. The largest nether quartz stack in the hotbar or inventory, not a bundle, adds the square root of its count, rounded, and that many quartz are consumed from that stack. Reach is your rounded ability level minus that ore's difficulty.
- String: Slow. It throws a web that bursts on a creature or a solid block. Spider eye: Sense Evil. A double-right-click casts it. Hold to eat the eye. Golden sword or heavy golden sword: Smite Evil. It costs 1/4 mana. With at least 1 mana, the crosshair turns gold on a creature in reach. Clay brick: Master Builder. Diamond: Diamond Skin. Glowstone dust: Empower. Quartz block in the air: Battery. Amethyst shard: Amethyst Shield.
- Slow flies up to ability level times 2 plus 4 blocks. The burst slows creatures within the ability level of the landing. The slow is 20% plus 5% per level, up to 80%, for 6 seconds per level. Above 100 health, both the slow and the duration are multiplied by 100 divided by that health. It does not affect you, or any player closer to you than the hit.

- Battery costs no mana. It lasts 2 minutes per ability level, at least 2 minutes, and multiplies mana regen by 1 plus the square root of its level. It renews until mana reaches your mana level, and ends when it does. A renew consumes one quartz block. Two in hand consume both and add +2.
- An amethyst shard casts Amethyst Shield for 1 mana. It lasts 1 minute per level on a targeted character, or you, and absorbs that much damage before armor. A hit within that level also skips harmful effects such as poison. Amethyst, lapis, and whole mana pay 1 per 3 points with one fuel, per 5 with two, and per 7 with all three, rounded up, alternating from the largest amount. If you cannot pay, the shield ends and the hit lands. One shard is consumed. Two add +2. Lapis in the hotbar or inventory adds another +2.
- A book at experience level 7 or higher writes a Tome of the Wise for 1 mana. Above experience level 30 it saves a share of the experience above level 30 and sets you back to level 30. At level 30 or below it saves a share of all your experience and sets you to level 0. That share, on writing and on reading, is 80% plus 2% per ability level, whether you were above 30 or not. Level 10 keeps the whole amount. Below 10 some is lost, and above 10 some is gained. The tome names you. One book makes one tome. Two or more add +2, and each further book makes another tome that splits the saved experience: three, four, or five books make 2, 3, or 4 tomes. More than five still uses five books and makes 4 tomes. Reading costs 1 mana and the tome. Sneak and right-click to open the book instead.
- Master Builder lasts 30 seconds times ability level, renews while you have mana, and cancels on another double-right-click with a clay brick. While it lasts, you can place solid blocks in the air, and block reach increases by the ability level. Torch rules still apply. One brick is consumed. Two in hand consume both and add +2. A renew spends a brick only when you are holding one, and that adds +2.
- Diamond Skin costs 2 mana and lasts 30 seconds times ability level. Below 2 it is practice and the diamond is kept. It renews while you have 2 mana, and a double-right-click cancels it. One diamond is consumed. Two in hand consume both and add +2. A renew spends a diamond only when you are holding one, and that adds +2.
- A diamond block double-right-clicked in the air or on a player casts Restore Life. Clicking a block with it still places the block. It gives one life to a friendly player in range, the way Healing picks someone, or to you. It costs 4 mana plus diamonds from the hotbar or inventory. The count is 17 minus that player's lives minus your Restore Life level, rounded down, and at least 3. The target must have fewer lives than player.death.lives, and Restore Life Available must be on. A missing requirement spends nothing and says what is required. The diamond block stays in your hand on a cast and on practice, whether you hold one or more. Below 1, practice spends the 4 mana and keeps the block and the diamonds. Two or more blocks in hand add +2.
- While Diamond Skin lasts, damage that would reach your health is divided by the ability level. Armor still applies first. Each point prevented shortens the effect by 3 seconds. Poison, drowning, and suffocation are not reduced. A quarter-second cyan sparkle plays when a hit is reduced.
- Below 1 a cast is practice: mana and focus are spent, the cooldown starts, and you gain one use. Diamond Skin practices below 2 and keeps the diamond. Read Tome keeps the tome. Restore Life keeps the diamond block. A missing requirement spends nothing. Below 1, once the requirements are met, practice spends the 4 mana and keeps the block and the diamonds.
- Redstone dust in the offhand adds half your skill, up to the square root of that stack rounded down. Success consumes that bonus, rounded down. Practice keeps the dust. Right-click does not place that dust.
- Bottom-right icons list abilities above level 2, highest first. Each icon is 5% of normal size times that level, and that level sits on its right at the same scale. Hold a book to see all of them. Otherwise only an active ability, one on cooldown, or the ability for the item in your hand is shown. Cooldown seconds are yellow on the icon. The level number is golden.
- Hold a focus and he teaches that ability for half the house points in uses, rounded down. Hold emeralds and he picks an ability for the house points. A 24-point home charges 30 emeralds from your inventory or either hand, minus 2 per point above 24, down to free. When a lesson is offered, he asks you to hold that many emeralds for a random ability, a focus for that ability at half the uses, or that many redstone blocks to deepen mana learning. A new hunt, or killing more than half the marks, offers the lesson.
- Hold redstone blocks instead. The first gift takes 1, then up to 4, 9, and 16. Fewer still count. Mana learning rises by the square root of the blocks he takes. When he takes those blocks, you shimmer red for one second per block. When he teaches an ability, you shimmer green for half a second per use.
- He offers a hunt every 30 Minecraft days. The pack is 3 to 8 from the home and his experience, plus 50% of that for each hunt you have finished with him. Creatures come from his own dimension.

- While he waits to give another hunt, he names up to 3 explored biomes that can still spawn a boss. If more than 3 can, he picks 3 and keeps them until that wait ends. While the next hunt is not ready, his message ends with the time left, like (3d) or (5h).
- The first hunts are easier creatures. Every 4 hunts, they are harder. The hunt lies 200 to 500 blocks north, south, east, or west, plus 33% of that for each hunt you have finished with him.
- His name, how many are left, and the direction show on your screen. That number falls as you kill them. At that distance the direction becomes near here. Come back closer and the direction returns. With under 4 days left, that line ends like (2d). On the last day it ends like (13h).
- After 2 minutes out there, on land, at night or below ground, half the pack appears within a few seconds, 20 to 40 blocks away. The rest still arrive one at a time, every 5 to 15 seconds.
- A mark in your line of sight gives off a red mist that other players can see, so it is not an ordinary creature. A golden carrot mists every mark until you are no longer saturated, and outlines them in white through blocks. Sense Evil does both for 1 minute times its ability level, and that time shows with the other ability durations. Each one has 50% to 100% more health. They give triple experience and double loot, and they always drop both. They vanish after 3 Minecraft days.
- Zombies, skeletons, drowned, strays, bogged, zombie villagers, and phantoms on a hunt do not burn in sunlight.
- Sense Evil also outlines every hostile mob within 8 blocks times its ability level. Solid blocks do not hide the outline. It lasts 1 minute times that ability level, shown as a spider eye at the bottom left. It says whether a biome boss can appear here. In a full chunk at Y=48 or above, it also says the alliance has cleared the area.
- The first creature of a hunt is slightly larger, has 5 times the health, and resists knockback. It gives 10 times the experience and 3 times the loot, plus emeralds equal to 5% to 10% of that health. The last creature has twice that health and hits 50% harder. It drops 3 times the loot, with emeralds equal to 5% to 10% of its own health.
- A creeper that explodes goes back on the spawn queue. A first or last creeper returns with that same role.
- An unfinished hunt ends after 14 Minecraft days. Each wise teacher can give you a different hunt, and each player has his own.

Achievements

- Place many of one block, or defeat many of one monster. One monster awards at 25, 50, 100, 175, 275, 425, and 600 kills, and those tiers pay 1 emerald through 7. Each claim gives 75 experience. A three-tier block track pays 1 emerald, then 2, then 3. A block that awards once at 64 pays 2 emeralds. Everyone can earn every achievement. Each wool block, wool slab, wool stair, and wool carpet awards once at 64. Glass, tinted glass, stained glass, and glass panes do too. Terracotta, glazed terracotta, concrete, concrete powder, and concrete slabs and stairs do too. Other blocks award at 256, then 512, then 1024.
- The first player on the server to claim one gets 25 extra experience by default.
- achievements.victory defaults to 0, which is off. Set it higher and the first player to earn that many achievements wins. Each builder tier and each slayer tier counts as one. Fireworks play, the credits scroll, and everyone can keep playing. While it is on, the top left shows how many you have earned out of how many are required.
- The command /tougher achieve lists the closest unfinished tracks. A block that has finished its single tier of 64 is left off, including when it is the last block you placed.
- Your experience level is the percent chance of a mana level. Mana learning, rounded down, is the die. It must roll above your mana level before Well Fed and gold. At 0 it cannot succeed.
- The first visit to a biome is 50 experience, and 100 more if you are first on the server. The first habitable home of a biome within 250 blocks is house points times 3. Another of that biome farther than 250 blocks pays again. The first trip 300 blocks from spawn is 100 experience.
- Sneak while holding a block you can place to see how many placements remain. Placing it is not required. A kill always shows that number. It drifts down and left for 3 seconds, and stays hidden when that track is finished.

Lapis portals

- A door framed in lapis blocks is a portal. Lapis sits under the door, above it, and beside both halves on both sides and on the side the door faces. The chest sits on top of that facing column. The opening, on the other side, stays clear. Wood and iron doors both open. The booth is remembered when that frame is finished.
- The largest stack of lapis lazuli in the chest is the link. A stack of 3 connects only to another booth whose largest stack is also 3. The lapis is not used up.

- Stand in the doorway and close the open door. The chest pays in redstone dust, nether quartz, or amethyst shards. One kind covers 100 blocks per item, rounded up, and the cost is at least 1. Two kinds cover 200 blocks per item. All three cover 400. Thunder plays within 200 blocks of either booth. You are dizzy and nauseous for 10 seconds, and both booths recharge for 15.
- The kinds already in the chest set that range. Payment alternates across those kinds, largest stack first. When the largest stacks match, nether quartz is first, then redstone dust, then amethyst shards. Each item comes off the largest stack of that kind.
- A count shared by more than two booths does not link.

Nether portals

- A nether portal spends the weight you are carrying. Worn armor, stacks, and tools all count. The fuel is taken from your inventory and your offhand.
- Fuel is redstone blocks, quartz blocks, and amethyst blocks. One kind covers 1 point of weight per block, rounded up, and a trip with any weight costs at least 1. Two kinds cover 2 points of weight per block. All three cover 4.
- The kinds you are carrying set that range. Payment alternates across those kinds, largest stack first. When the largest stacks match, quartz blocks are first, then redstone blocks, then amethyst blocks. Each block comes off the largest stack of that kind.
- Leaving the overworld rolls a d20. A roll above the world counter, which starts at 0, raises that counter by 1. That counter damages animals within 64 blocks: armadillo, bee, camel, cat, chicken, cow, donkey, fox, frog, goat, horse, llama, trader llama, mooshroom, mule, ocelot, panda, parrot, pig, polar bear, rabbit, sheep, skeleton horse, sniffer, strider, turtle, wolf, and happy ghast. What those animals do not lose hits the traveler.
- A trip with nothing to carry is free. After any trip you wait 15 seconds before a nether portal will take you again. Everyone on the trip pays their own weight. If anyone cannot pay, or is still waiting, nobody goes and nothing is spent.

Homes and residents

Right-click a bed with a clock to score a room. An enclosed room of 24 to 400 air blocks, with block light 5 on every floor tile, a bed, and a door or fence gate facing outside, can attract one resident if it has at least 12 furnishing points and stays 20 blocks from another occupied home. A home more than 50 blocks from the nearest other occupied home gains 1 point, or 2 points when more than 100 blocks away. Furnishings come from size, extra rooms, windows, art, rugs, seating, storage, workstations, lights, plants, books, a second bed, and a kitchen. Empty eligible homes are checked at dawn. Chance starts at 8% at 12 points and rises with the score. It is halved in blight. Chests bias a hauler, a kitchen biases a cook, and plants or workstations bias a farmer. A cauldron favors a brewer, who can come to a 12-point home. An old miner can come to a 12-point home. 18 points can bring a loot collector or a council member. 24 can bring a jeweler, an armorsmith, or a wise teacher. 30 can bring a wealthy trader or a master armorsmith. A job with more than twice as many residents as the smallest job that home can host is skipped. Wise teachers and council members are skipped only past three times that number. Council members are especially likely. New residents prefer a specialty that has not appeared yet.

- The clock also names one improvement that would still raise the score. It keeps that suggestion for 3 minutes. When that improvement no longer adds points, the next look names another one.
- Three new suggestions are named in one Minecraft day, across every home. The suggestion still on the clock can be read again. After three, the clock names no more until the next day.
- A resident will not appear within 35 blocks of a villager. Other residents do not count.
- The name over a resident is their name and occupation, such as Alden the Jeweler. Each name is used once before any name is used again.
- An old miner, such as Jack the Old Miner, can live in a 12-point home. Speak to him for a lead. He does not keep a shop. Every 7 Minecraft days he names the largest vein of one ore in his chunk and the eight chunks around it, and he adds more of that ore beside the vein. He names only ores found in that ground.
- The fee is 1 emerald for each 8 house points, rounded down. Without those emeralds in hand he names the ore and the fee. Hold that many emeralds and he takes them and names the direction. The 7 days start then.
- The list is the easiest of those ores he has not finished with you. Its length is the home's points plus the leads you have finished with him, divided by 5, rounded up. Finishing an easier ore lets the next harder ore there join the list. He does not repeat an ore until every ore there has been named. A lead you never finish can be named again.

- The line reads Jack: Iron East. The direction is North, South, East, West, Up, or Down, whichever is farthest, and it changes as you move. Within 3 blocks the lead is finished. It expires after 7 Minecraft days. Each player has a separate lead, and one miner can lead several players at once. With under 4 days left, that line ends like (2d). On the last day it ends like (13h).
- Clock a resident, then clock another. They trade homes at once, even far apart. Each refuses a home below their job. A loot collector or council member needs 18. A jeweler, armorsmith, or wise teacher needs 24. A wealthy trader or master armorsmith needs 30. Everyone else needs 12. The trade costs half the points of the finer home, rounded down, in emeralds. Their shop stays until the next restock. A council member keeps the hunts already finished with you.
- Clothes are a villager outfit, so two of one occupation may look different. A jeweler, wealthy trader, or loot collector wears a finer coat. An armorsmith or wise teacher ranks higher, and a master armorsmith or council member wears the highest rank.
- Most residents restock every 14 Minecraft days. Armorsmiths restock every 30. Look at one who is waiting to see the time left, in days and hours.
- Shop size follows house points. The top of the roll is 50% at 14 points and 175% at 38. Higher scores stay there. The bottom is half of that. Prices do not inflate. A hauler pays 1 emerald for 32 of a block. Each chest, barrel, or shulker box takes 2 off that stack, down to 16.
- A farm neighbor sells 8 wheat for 1 emerald. Seeds, carrots, berries, pods, and sugar cane are 3 for 1 emerald. A smaller home may also sell a sapling for 2 emeralds, 4 bone meal for 1 emerald, 1 pumpkin for 1, 1 melon for 1, or 12 beetroot for 1.
- Potatoes, pumpkin seeds, melon seeds, cocoa beans, and nether wart need a larger home. Each is 1 for 1 emerald.
- A trader also buys each thing he sells. The buy stack is 2 larger and pays the same number of emeralds. Those buys start with no uses. Buying from him adds 1 use to each of them. Selling him anything spends 1 use on each of them.
- A trader or a wealthy trader offers other players' chests after his own trades. Put a sign on a chest, including a trapped chest, whose first matching line is SELL or BUY. A double chest is one shop. Barrels, ender chests, and shulker boxes are not.
- The sign can be on the side of the chest, standing on top of it, or hanging under it. Blank lines are skipped. The player who finishes the sign owns the shop, and a new sign on that chest replaces the old one. Your own chest is not offered to you. The chest can be anywhere, including another dimension, and it does not have to stay loaded.
- A SELL chest is read from the top left, across each row. Items before the first emeralds are not for sale. An emerald stack sets the price, from 1 to 64, for the items after it. A later emerald stack sets a new price. Emeralds in the bottom two rows do not set a price.
- The first stack of an item sets how many he sells in one trade. Later stacks of that same item are extra stock, and he sells those first. They are not a second offer. Emeralds themselves are never sold. Five emeralds, then 16 iron, then 64 more iron, sells 16 iron for 5 emeralds.
- The emeralds you pay join emerald stacks in the bottom two rows, starting at the bottom right, then the next stack toward the top left. If those stacks are missing or full, they go in the bottom-right empty slot. He keeps selling while the chest has room for those emeralds. There is no other limit.
- A BUY chest is read the same way, but only above the bottom row. An emerald stack there sets the price, and the next new item is the sample: what he buys, and how many. That sample stays in the chest. A later stack of the same item is not another offer.
- The bottom row is the wallet. He spends those emeralds from the right. Bought items land on the bottom row first, then on the row above, past the sample. Eight emeralds and then 16 wheat, above that wallet, means he buys 16 wheat for 8 emeralds.
- He keeps buying while the wallet can pay and those rows have room. There is no other limit. A trade from another player's chest gives no experience to you or to the resident.
- A jeweler sells a diamond for 8 emeralds, 4 gold ingots for 2, an iron block for 6, and a copper or redstone block for 2. Larger shops add lapis, amethyst, quartz, gold nuggets, ingots, and blocks of gold, lapis, amethyst, quartz, and diamond. A gold block is 6 emeralds and a diamond block is 32.

- An armorsmith sells one heavy iron piece each restock. Which piece can change. The other sales are enchanted iron armor, each a different slot. A larger shop may buy iron. Heavy iron costs 12, 15, 21, or 24 emeralds for boots, a helmet, leggings, or a chestplate. Enchanted iron costs 6, 8, 11, or 12. A master armorsmith does the same with diamond: one heavy piece at four times the iron price, enchanted diamond armor at the heavy iron price, and a larger shop may buy diamonds.
- A brewer sells one level 2 potion each restock. Which potion can change. Up to three other potions cost 1 emerald. A larger shop sells one of each brewing ingredient for 1 emerald, such as nether wart, blaze powder, glowstone, and ghast tears.
- A loot collector pays 1 emerald for 4 spider eyes, 4 gunpowder, or 8 bones. A larger shop also pays 1 emerald for 8 rotten flesh, 8 string, 4 slimeballs, 6 leather, 12 arrows, 6 ink sacs, 2 phantom membranes, 2 ender pearls, 2 blaze rods, or 1 ghast tear.
- Each trade adds 1 to that resident's trading experience. When their stock changes, the square root of that experience is added to the house points for the new shop.
- That stock change also rolls item amounts once from -25% to +25% and adds 0 to 25 from the house and trading experience. Buying gives that many more items. Selling to the resident asks for that many fewer. Emerald prices stay the same.
- Residents have 40 health plus their house points, and regain 1 health a minute. Looking at one shows hearts, one per 10 health, beside the restock time.
- After a mob hits them, they shoot mobs within 12 blocks that are after them. The bow hits 3 harder than a normal arrow. A close attack makes them switch to an iron sword.
- A zombie cannot turn a resident unless the hit that kills them starts while they are already below 5 health.
- A home stops listing a resident who has died or is no longer around the bed.
- A loot collector warns you when a biome boss is out, and names the compass direction from that resident. East is where the sun rises.
- Council members each name a personal kill bounty. Hold 5 emeralds in your hand to take it, and those 5 are spent. The first hunt is 6 to 18 common mobs, with 14 Minecraft days to finish. Each success with that resident makes their next hunt 20% larger. Every 4 successes, that resident's next hunt is rarer. A mob above 20 health is fewer creatures, in proportion to that health. The resident only sends mobs from their own dimension. Guardians are left out. Another council member keeps a separate ladder, so one can stay easier. You can hold 5 at a time, including ones waiting for emeralds. The next bounty from that resident waits 7 Minecraft days after the last one was given, plus 3 Minecraft days for each bounty finished with that resident, and only after you finish it.
- A kill counts toward every open bounty on that mob. A bounty shows Ada: 9 Zombies above the ability icons: the council member, how many are left, and the mob. With under 4 days left, that line ends like (2d). On the last day it ends like (13h). Lines stack upward. A bounty that runs out is not replaced in that conversation. The reward is experience from the slain health, plus emeralds when you return to that resident.
- At night a bounty may send a group within 64 blocks on a dark block. Half of those creatures come straight for you. The rest wander where they appeared until they notice you. Those creatures appear only in the dimension where that bounty was given. Each second a 1 in 250 chance usually brings 1 or 2, at least 1 and from 1/6 to 1/3 still owed, until the next Minecraft day. Each bounty rolls on its own.
